

Nick Pantier

Staff Software Engineer — Design Systems & Frontend Architecture

Monument, CO · pantier.nick@gmail.com · npantier.github.io · linkedin.com/in/nickpantier · github.com/npantier

SUMMARY

Staff Software Engineer specializing in design systems and frontend architecture, rooted in graphic and interactive-media design. A decade in frontend — lately architecting component libraries from the ground up, leading org-wide migrations, and building the AI-assisted tooling that multiple engineering teams depend on daily, for a high-traffic consumer healthcare platform. A designer's eye for craft with an engineer's leverage: I review nearly as much code as I write.

SKILLS

Languages & Frameworks: TypeScript, JavaScript, React, Next.js, Node.js, HTML5, CSS3/SCSS, Java

Design Systems: Design tokens, component API design, theming, Storybook, accessibility (WCAG 2.1 AA), responsive/mobile-first systems

Tooling & Platform: AI-assisted developer tooling (Claude Code skills/plugins), codemods, monorepos, pnpm, Webpack, micro-frontends, CI

Practices: Frontend architecture, large-scale migrations, performance optimization (Core Web Vitals), code review & technical standards, dependency-security remediation

EXPERIENCE

Healthgrades

Denver, CO · July 2014 – Present

Acquired by Red Ventures (2021); now operated under RVO Health, a Red Ventures + Optum joint venture

Staff Software Engineer (2025–Present) · **Senior** (2018–2025) · **Associate** (2014–2018)

- Architected a greenfield design-system component library end-to-end — design-token packages, accessible primitives (Combobox, Meter, Field, Button), runtime config validation, and a mobile-first responsive model — now consumed by 4 teams across a dozen-plus applications.
- Founded the company's AI & Engineering Chapter — grown from the Front End Chapter I lead — cross-team forums for technical knowledge-sharing and advancing AI adoption across the org.
- Led the org-wide migration off a legacy design system across 12+ repositories, eliminating duplicated UI code and unblocking a platform-wide framework upgrade.
- Built AI-assisted migration tooling (Claude Code skills, a plugin library, and codemods) that cut per-repo migration from ~2 days to ~1 hour — a self-serve workflow the whole frontend org runs.
- Delivered accessibility at the source: audited design-system color tokens for WCAG 2.1 AA contrast so fixes propagated to every downstream application at once.
- Designed a typed localization layer that treats user-facing text like theming for the React render tree — a single typed contract defines every string slot, locale dictionaries satisfy it, and clients override per-locale at mount time.
- Modernized the build pipeline (LESS→SCSS, Storybook 8→10, pnpm) and drove frontend performance — render and critical-CSS optimization, Core Web Vitals — on the highest-traffic, SEO-critical pages.
- Owned the search-autosuggest experience end-to-end — a low-latency, type-ahead app and supporting library — plus syndicated-search and provider-discovery surfaces.
- Primary code reviewer for the frontend org — 1,166 teammate PRs reviewed, a near 1:1 ratio with my own authored work — and shipped 1,095 merged PRs at a 90% merge rate across 48 repositories spanning TypeScript/React frontends and Java services.

EDUCATION

The Art Institute of Colorado — AAS, Interactive Media Design

2007 – 2009

University of Wyoming — BA, Art / Graphic Design

2001 – 2006
